Oral drop as Complementary Treatment for Benign Prostatic Hyperplasia (BPH)

Benign prostatic hyperplasia (BPH) also called enlargement of the prostate, is a progressive condition related to ageing characterized by prostate enlargement accompanied by lower urinary tract symptoms (LUTS). Several mechanisms seem to be implicated in. These include age-related tissue modifications, hormonal alterations and inflammation which would stimulate cellular proliferation.

BPH involves an increase in the number of prostate gland cells, resulting in the formation of large nodules in the prostate. These nodules may compress the urethral canal to cause obstruction of the urethra which interferes with the normal flow of urine. It leads to symptoms of urinary hesitancy, frequent urination, urinary tract infections and urinary retention. Although BPH is not life threatening, its clinical manifestations reduce the patient's quality of life.

ayicina Pumpkin oral drop is a natural oil of styrian pumpkin seed oil that produced from "*Cucurbita pepo var. styriaca*" which improves benign prostatic hyperplasia (BPH) and has not any side effects.

Active substances of pumpkin inhibit inflammation of prostate, balance hormones and also unsaturated fatty acids, vitamin E and Zinc existing in styrian seed oil improve the activity and health of genital and urinary system.

Three times a day, each time 10-15 drops.
